When a product fails after many years of service, or information on how to repair the vehicle has been lost, problems can arise when trying to fix the vehicle. Many electronics become obsolete and out of production making repair difficult. Sometimes a specialist can repair the component but this isn't always ideal if the item is a regular problem or if a fleet of vehicles have them fitted.

Sometimes the item to be repaired is beyond repair or parts to fix it are becoming a little thin on the ground. Having been on the end of this stick and knowing how difficult it can be to keep a vehicle on the road with failing obsolete parts we know only too well how this feels. Your truck should be on the road earning you money yet circumstances beyond your control prevent this.
