

FSL develop and deliver another UK first, a fully EV to the Cash and valuable In Transit industry.

The vehicle was developed and delivered to a European client who has a depot in the London area.

The vehicle had many of the usual security features you would expect, secure load partitioning, external body enhancement protection, slam door locking, monitored doors Uprated glass, multi camera CCTV system and heavy-duty locking systems.

All ancillary equipment is powered and controlled by an independent power supply which, has no interaction with the manufacturers electrical system.

This current vehicle has a range of about 90 miles which, is adequate for client, who routinely travels around the centre of London.

If you would like to discuss any future projects you are considering and would like to consider utilising the possibility of an EV please contact FSL
